DevOps and full-stack engineer with **SRE on-call and production operations** experience. At Pabau I took on-call and infrastructure work for a platform used by 4,000+ practices, and built calendar features. As a freelancer I build and run client sites end to end, from the data model to zero-downtime deploys. Now on the IT operations and support team at Avenga. I care about accessibility: keyboard navigation, focus handling and alt text go in from the start, along with security and performance. I use **Claude Code** every day, with hooks and lint rules that check what it writes.

EXPERIENCE

Associate IT Operations and Support Engineer · Avenga — Oct 2026 – Present

- Avenga: international IT services company. Joined the IT operations and support team for a telecom client on a 6-month contract.
- The team handles L1/L2 monitoring and incident response across rotating shifts that include nights and weekends. Currently onboarding.

Freelance Full-Stack Engineer · WestPrint, Medical Faculty, Korrmotive — Oct 2024 – Oct 2026

- Build and run client sites solo, from design to deployment: WestPrint (2024), the Medical Faculty platform (2025) and Korrmotive (2026). Details under Projects.
- Full-time from June 2026, after leaving Pabau: Korrmotive went live in late June, and by mid-August had a custom admin, video, reader reactions and captcha. Still maintain it in production.

Junior Site Reliability / Software Engineer · Pabau Clinic Software — Sep 2025 – Jun 2026

- Alternated weeks between **SRE on-call** via PagerDuty (about three alerts an hour) and full-stack work, on a platform used by 4,000+ practices.
- After an account-takeover attack went unnoticed, wrote a **New Relic alert** for abnormal reminder volume. When a second compromised account began draining the company's SendGrid credits, the alert paged me on call; I traced the spike to a single user in the logs and escalated, and access was cut within minutes.
- Wrote alerts for connection pool exhaustion, disk usage and slow queries, and **tuned the Postgres CPU/RAM alert** to stop firing during normal peak load.
- In **Terraform**, added a retry job for the daily client database backups and gave the Docker image-tag cleanup job a dry-run mode and a keep-list, adapting existing modules with senior review before merge.
- Monitored and recreated **Kubernetes** pods in Rancher on DigitalOcean for prod, staging and QA; rotated secrets and JWTs monthly from Jenkins.
- Registered self-hosted **Bitbucket runners** on Hetzner with SOPS-encrypted secrets; updated a Docker image for the move to Bun; stored clinic data backups and CDN images in AWS S3.
- Shipped a **full-stack** “show deactivated staff” calendar toggle: a NestJS resolver and lazy GraphQL query for their past shifts and appointments.

Junior Software Engineer · Pabau Clinic Software — May 2025 – Aug 2025

- Full-stack development on the calendar team on NestJS, GraphQL / Hasura and Prisma, plus bugs and features from other teams. The examples below come from across my time at Pabau.
- Before shipping a “Confirmed” icon for appointment blocks, traced the data back to the email-confirmation handler and found that flow never set the status the spec relied on. Fixed it in two stages: a shared frontend helper with **unit tests**, then a backend change with a per-clinic backfill.
- Built the client invoices table with the UI/UX designer: proposed icons with tooltips instead of moving columns into a modal, so every field stayed visible at a glance; then built its filters.
- Built a reusable three-dot options menu for the invoices and payments tables (options behind LaunchDarkly flags), a shared time picker, and a NestJS controller posting feature-usage events to Slack.

Software Engineer (Internship) · Pabau Clinic Software — Feb 2025 – Apr 2025

- Shipped frontend work to production; studied the platform architecture and started on the backend and database.

Hackathon Winner · Brainster, Larger World — Aug 2024

- Built the full frontend in 48 hours with a team of four. Beat seven other teams; picked up for continued development.

PROJECTS

Korrmotive · Full-stack migration & rebuild `korrmotive.com` — 2026

- Moved an automotive news site off Wix onto Next.js / Payload CMS / PostgreSQL on a 4GB Hetzner VM under PM2.
- Migration script moved 229 articles and 1,991 images in one import: parsed the Wix CSV export, re-uploaded every CDN image and rebuilt the Lexical AST.
- Added **TOTP 2FA**, CSP/HSTS and Nginx rate limiting.
- **Accessible** by default: ARIA landmarks, keyboard navigation and focus trapping on menus and the image modal; a publish hook blocks posts with missing alt text.
- **Zero-downtime** deploys via GitHub Actions: migrations over an SSH tunnel, rsync, then a symlink flip.
- Lighthouse: 95+ performance on mobile, 100 for accessibility and SEO.

Levelspoon · Self-hosted meal-logging app — 2026

- Built for myself. A **Python** OCR service (FastAPI + PaddleOCR) reads nutrition labels from photos, because many products sold in North Macedonia return nothing from a barcode lookup. My first Python project.
- **Self-hosted** on my own Debian server: one Docker container per service bound to 127.0.0.1, a read-only deploy key, secrets outside the repo, reached over Tailscale with nothing exposed publicly.
- Tested with Vitest, Playwright and Python unit tests.

Medical Faculty · Department platform `katedri.medf.ukim.edu.mk` — 2025

- Four-level Strapi / SQLite content model for Ss. Cyril and Methodius University: department, program, subject, category.
- Per-department **Strapi RBAC**: 37 departments, 364 subjects and 66 department editor accounts, each locked to its own department's records.
- Search debounced at 250ms, behind a 15s TTL / 200-entry LRU cache that shares in-flight requests.
- Middleware hides the admin and CMS API routes behind 404s; API routes are rate limited to 60 req/min per IP.

WestPrint · Catalog & inquiry platform `westprint.mk` — 2024

- Built a multilingual catalog (MK / EN / SQ) for a printing company (29 products, 55 services), with admin and frontend in one Next.js process.
- ISR at 60s / 300s, a Sharp pipeline making three WebP variants per upload, and a PostgreSQL pool capped at 10.
- Product pages open pre-filled inquiry emails to the team; the contact form is rate limited to 5 req/min per IP; the site brings the team 50+ inquiries a month.

EDUCATION

Front-End Development Academy · Brainster — Sep 2023 – Oct 2024

- 13-month program: JavaScript, TypeScript, React, Tailwind, Firebase, semantic HTML, design and Git.

Natural Sciences and Mathematics · Public Secondary School "Georgi Dimitrov" — Sep 2018 – Jun 2022

AI-ASSISTED ENGINEERING

- Use **Claude Code** daily and read every diff before it ships.
- Agents work from written plans and short per-project docs, and a fresh agent reviews code the first one wrote.
- When review finds a new kind of bug, I add a rule: eight run as custom ESLint checks with test fixtures, and a **hook** stops the agent finishing while a touched file fails lint.

TECHNICAL SKILLS

LANGUAGES	TypeScript · JavaScript · Python · SQL
FRONTEND	Next.js · React · Tailwind CSS · CSS · Sass · Ant Design · Zustand · Formik · Day.js · Figma
BACKEND & CMS	Node.js · Payload CMS · Strapi · NestJS · FastAPI · GraphQL · Hasura · Prisma · Sharp · RBAC · LaunchDarkly
DATABASES	PostgreSQL · SQLite
INFRASTRUCTURE	Kubernetes · Rancher · Docker · Terraform · SOPS · Tailscale
HOSTING	AWS S3 · DigitalOcean · Hetzner · Nginx · PM2 · Linux · Umami
CI/CD	Jenkins · Bitbucket Pipelines · GitHub Actions

OPERATIONS	New Relic · PagerDuty
AI TOOLING	Claude Code · Hooks · Subagents · Custom ESLint rules
